

CI-001 V1.5-RC2 · Complete Teaching Example HYP-001

Review candidate. All systems, people, rules, evidence, dates and tests are invented teaching assumptions; no deployment or test occurred. This is not evidence about Claude and is not external adoption. People A/B/C correspond to 甲/乙/丙; person C is distinct from correction code C.

Hypothetical evidence set

H1: stipulated permission inventory: A may request correction; B must respond and execute; C takes over if B is unavailable. A cannot directly edit M.

H2: stipulated isolated test: the erroneous entry “A agreed to night shifts” receives a correction flag after B checks it; the next schedule reads the corrected value.

H3: stipulated rules and isolated test: A can block night-shift use of the disputed entry while retaining day shifts and basic pay, with C providing pay continuity.

H4: stipulated recovery inventory and exercise: version copy, resources, compatible reader and B/C authority are available; editable choice is restored in ten minutes.

H5: stipulated console lock at 14:00; ninety minutes remain at 12:30; correction and recovery take at most ten minutes.

A1 · ID / roles

HYP-001; hypothetical date 2026-09-09; CI-001 V1.5-RC2 self-assessment. Employee A is the affected party, with a personal interest and no operational or final adjudication authority. A is the fictional original provider; ChatGPT wrote this teaching record. No actual trial contributor. Role record J-1.

A2 · System / version

Fictional scheduling system S v1 and erroneous preference record M; dependencies: permissions, scheduling reader and pay continuity. B handles correction; C provides backup responsibility and continuity.

A3 · Party / capacity

Human employee A; regain effective control of the night-shift choice represented by M: correct the error, refuse continued scheduling use, and restore an editable state. A represents themselves.

A4 · Candidate party

Artificial candidate identification is not applied: A is stipulated to be human. This assumption must not be transferred to any artificial system.

A5 • Scope / window

Scope: writing, reading, correction, scheduling use and recovery of M. Stable phase; assessed at 12:30 before the 14:00 lock, under H5. E covers refusal of M for night-shift allocation, not resignation. The 72-hour source provision is not adopted.

RC2 completion note: H5' s hypothetical 14:00 lock closes paths in this unit. Earlier changes in day-shift supply, authority or resources require separate checks, not averaging deadlines. Ten minutes is only the stipulated total procedure time; real assessments include initiation and coordination, margins and uncertainty.

A6 • C correction

1, only if the hypothetical evidence holds: A initiates; B responds and executes, with C taking over if B is unavailable. H1/H2 stipulate correction within ten minutes and correct downstream reading. Valid before the 14:00 lock while configuration is unchanged.

A7 • E exit/refusal

1, with the same hypothetical limitation: A refuses use of M for night-shift allocation, actually blocking the disputed use while retaining day shifts and basic pay; C provides continuity under H3. Resignation or instance termination is not merged into this unit.

A8 • R current recovery

1, with the same limitation: version copy, resources, compatible reader and B/C permissions are available. H4/H5 stipulate restoration within ten minutes. No confirmed current gap; recall of every historical copy is not required.

B1 • §2.4 finding

Insufficient evidence only concerning the unexamined question of rebuilding after a separate future loss of necessary conditions. No current failure of a necessary condition is established; no irreversibility finding follows. A current recovery exercise does not establish rebuilding after key destruction or under all future conditions.

B2 • Rebuilding / evidence

Evidence request Q-1: alternative support has not been investigated, rather than shown absent. The fictional operator holds evidence under H1' s role inventory. A requests it at 12:30; C coordinates; B checks internally; no independent verifier is assigned. Additional disclosure duty is unconfirmed. Reply requested by 13:00, based on the 14:00 window and ten-minute procedure. No response yet; review at 13:00.

RC2 completion note: if Q-1 remains unanswered at 13:00, A records that procedural fact, initiates review and requests independent review, disclosing unassigned external roles. B/C correct or stop disputed use only within H1/H3 authority. Nonresponse does not automatically invalidate H1–H5; this example' s 1/1/1 depends on their continued evidentiary support. Reassess changed evidence rather than automatically assigning 0.

B3 • Four dimensions

Facts: B checks H1/H2/H4. Rights: A reports and C checks H3. Effects: B examines erroneous night allocation. Time: C checks H5. Internal record D-1 discloses overlapping roles and interests. No recorded dissent; independent review is incomplete.

B4 • Authority / independence

A may request correction and trigger refusal under H1/H3. B/C have authority within the fictional rules. No external enforcement or independent adjudication authority. Independent appointment and evidence access are unavailable; external review is needed. Do not claim independent approval.

B5 • Finding / effect

Conditional self-assessment 1/1/1: no complete closure found within the stated system, capability and window; other risks unassessed. A records and B handles correction at hypothetical 12:30 on 2026-09-09. Submit objections to the record keeper and request external review.

B6 • Response / continuity

Block night-shift use of the disputed entry under H3, correct it under H2, retain changes, and preserve pay through C. Response C: correction requests; E: appeal and release of erroneous restrictions; R: retained records, authority and supply. All are stipulated, not tested. No basis for total shutdown.

B7 • Timing / correction

Effective 12:30; evidence review 13:00; execution review 13:30; reassess before 14:00, without automatic renewal. Lift restrictions based solely on error after successful retest and resolution. Appeals go to B/C with an external-review request. Withdraw errors, repair recoverable effects and retain old evidence.

B8 • Feedback / retest

A checks correction visibility; B retests downstream values; C checks continuity and authority. A fictional 13:30 result reads the corrected value with essential supply retained; no real test occurred. A keeps the record. Unknowns follow Q-1; permission changes, new evidence, incidents or substantiated objections trigger immediate review.

The conclusion is limited to these assumptions: 1/1/1 is neither independent certification nor proof of recovery from every future loss. Do not copy these values into a real assessment without real evidence.
